

## – 01 NATURAL COLOURING

# Natural Colouring *through Reactive Stains.*

The unique colouring of our oak products is created through a natural reaction of the wood tannins with special stains. Unlike conventional products coloured with pigments, there is no artificial colouring here. The result is a natural and intentional play of colour that beautifully reflects the irregularity of nature.

## Why the Colour Varies

Since the concentration of tannins in each oak board differs, individual planks and even areas within the same plank can appear lighter or darker. These colour variations are a quality feature and lend your floor incomparable vitality.

After installation, it can take some time for the floor to reach its final colour. In the first few weeks a colour change is observable, which slows down over time. Lighting conditions can also influence this process. The colour of the individual elements also harmonises over time.

## – 02 SMOKING

# Natural Colouring *through Smoking.*

Smoked products receive their unique colouring through an elaborate smoking process in which the wood is carefully and gently treated with a special recipe. This reaction of the natural tannins in the oak wood creates natural brown tones. After installation, it can take some time for the floor to reach its final colour.

In contrast to other treatments, our gentle process can slightly reduce the colour variation, resulting in a particularly harmonious appearance. Nevertheless, the natural irregularities of the wood remain visible and lend the floor a lively character.

Our products are the result of decades of development and craftsmanship passed down through generations of the Meyer family.
